Abstract (en)

[origin: EP2728035A1] The method involves coating the surface (2) of component (1) with a layer of material with specific composition such that the component melts at lower temperature than the component material, or forming with the component material such that the component has lower melting temperature than the component material. The coated component is subjected to heat treatment, so that the component is held between the coating and the component diffusion processes. The layer material is provided with melting point depressant element component material. An independent claim is included for a component.
