Abstract (en)

[origin: EP2728171A2] A rotor blade assembly 22 for a wind turbine 10 includes a ring insert 100 in the blade root section 104. The blade root section 104 has a span-wise end portion defined by an inner circumferential component 122 and an outer circumferential component 124, with a radial gap 136 between the components. The ring insert 100 is disposed in the radial gap 136 and is bonded to the inner and outer circumferential components 122,124. The ring insert 100 has an inner circumferential surface 126 and an outer circumferential surface 128, wherein at least one of the inner or outer circumferential surfaces 126,128 has a radially varying cross-sectional profile that increases bonding surface contact area between the inner or outer circumferential surface 126,128 and the respective circumferential component 122,124 of the blade root section 104 as compared to a constant radius cross-sectional profile.
