Abstract (en)
[origin: WO2013041455A1] The invention relates to a rotary printing machine having a printing mechanism, which is assigned at least one cylinder and which has at least two stores that are coupled to a guide system and can each be moved relative to the rotary printing machine and relative to one another, each one of said stores being able to be positioned in a defined transfer position and having at least one receiving means for receiving the at least one cylinder, wherein the printing mechanism has a movable handling means, which is assigned permanently to the respective store and by means of which the at least one cylinder, held in a positionally fixed manner to cylinder receptacles of said handling means, can be transferred between an installation position in at least one storage receptacle of the printing mechanism and a supply position in a receiving means of a store, and wherein the at least two movable stores are each arranged such that said stores can be moved along the guide system at least by means of one component in the vertical direction and at least by means of one component in an axial direction. The invention further relates to a method for replacing at least one first cylinder of a rotary printing machine.
