Abstract (en)
[origin: WO2013004207A1] The invention relates to a lever system for operating a torque transmission device, such as a coupling in the drive train of a motor vehicle, comprising a lever, which is mounted on a bearing point so as to rotate about a joint and which comprises a force application point that can be moved parallel to the axis of rotation of the torque transmission device. The force application point is in operative connection with an actuator, wherein a bend point, such as a joint or hinge, is provided between the force application point and the actuator and is spaced from the force application point and the actuator.
