Abstract (en)

[origin: EP2730527A1] The winder has a reel (1) of a band (2), and another reel (3) of another reserve band (4). A frame (5) is arranged for supporting the former reel and the latter reel one behind the other approximately in a same unfolding plane by leaving a space for passage of the bands. A raising device includes a raising axis (10) that is ready to be moved from a low position located downwards of the reels i.e. preferably under the latter reel, to a high position corresponding to a connection point provided as a blocking unit (8a) in the high position. An independent claim is also included for an assembly of a set of winders.
