Abstract (en)

[origin: EP2730702A1] The method involves adjusting depth (T) of jet tools (8, 9) such that exhaust nozzles of the respective jet tools lie in a plane that is perpendicular to longitudinal axes of the jet tools. The jet tools are rotated around the respective longitudinal axes for applying injection medium into ground based on the depth of the jet tools. Angle position of one of the jet tools is controlled such that the exhaust nozzles of the respective jet tools are aligned simultaneously on an area of the ground, where the area lies between the jet tools. An independent claim is also included for a device for producing parallel ground bodies.
