Abstract (en)

[origin: EP2730728A2] The device (1) has a control unit movably integrated in a joinery, and including a drive part that co-acts with a rod to move the rod when moving the control unit. A coupling part (61) couples the control unit and an operation element such that operation of the operation element actuates the movement of the control unit. The control unit is divided into two parts that are connected together, where one of the parts co-acts with the drive part when the coupling part is separated from the corresponding part. An independent claim is also included for a method for assembling a movement control device.
