Abstract (en)

[origin: WO2013010534A1] The invention relates to a closure for closing a door, in particular an appliance door, with a second closure element (3) which is lockable to a latching structure (4) of a first closure element (2) and is rotatable relative to the first closure element (2) for unlocking purposes, and with at least one lever bearing (5) which is arranged movably in relation to the second closure element (3) and is transferable from a release position, in which, as a result of a relative rotation, said lever bearing undoes the locking to the latching structure (4), into a blocking position, in which the locking to the latching structure (4) is maintained during a relative rotation, wherein the lever bearing (5) is also arranged movably in relation to the first locking element (2).
