Abstract (en)
[origin: WO2012167471A1] The present invention relates to a method for a receiver of synchronization signals for synchronization to a secondary component carrier in a wireless communication system, comprising aggregation of one primary component carrier and at least one secondary component carrier, characterized by: obtaining side information of said secondary component carrier; utilizing said side information to reduce the number of synchronization hypotheses; and determining at least symbol timing synchronization of said secondary component carrier. Furthermore, the invention also relates a computer program, a computer program product, and a receiver thereof.
