Abstract (en)  
[origin: DE102011079534A1] The dishwasher (1) has a closed door (3) for closing a washing receptacle (2) in a closed position. A locking arrangement allows the door to be locked in the closed position and comprises a movably mounted locking element. A sensor system detects a movement of the locking element caused by a force acting on the door along direction of the washing receptacle. The sensor system is connected with a component. An actuator unlocks the door and opens the door based on the sensed movement. A decorated tile is gap-freely attached at an outer wall (3-1) of the door. An independent claim is also included for a method for opening a door of a household dishwasher.
