Abstract (en)

[origin: US2014172396A1] A method for generating and optimizing physical system architecture by modeling a problem in the form of a model. The physical architectures (AP1, AP2, . . . , APN) are generated using the model and algorithm that searches for a function with viable and valid combination of components. The physical architectures are evaluated according to a plurality of attributes or criteria using analysis modules based on the model. A part of the physical architectures is selected based on dominance relations. New physical architectures (AP'1, AP'2, . . . , . . . , AP 'N) are generated by applying genetic operators to the physical architectures (AP1, AP2, . . . , APN). The results are synthesized by retaining a part of the physical architectures.
