Abstract (en)

[origin: EP2738324A2] The lock (1) has a stop element (13) engagement with a rotary unit (12) to block rotation of the rotary unit. The stop element is engaged with a close mechanism out of engagement of the rotary unit by an active compound. A locking element (15) is cooperated with a part of the close mechanism such that the locking element locks mobility of the stop element when the locking element is moved to a protruding position, and the locking element releases mobility of the stop element when the locking element is displaced into withdrawn position.
