Abstract (en)  
[origin: WO2013020620A2] A process for producing an electrically conductive material (5) is proposed, wherein the process comprises the steps: a. provision of a carbon fibre (3), b. provision of a polymer fibre (4) which is different from the carbon fibre (3), c. provision of a mixture in the form of a sheet-like lay-up (2) of the carbon fibre (3) and the polymer fibre (4), d. optionally drying of the mixture (1), e. consolidation of the mixture (1), f. optionally cutting-to-size of the mixture (1), g. carbonization of the mixture (1), where the carbonized polymer fibres (4) form a carbon-based, electrically conductive matrix (6) which at least partly surrounds the carbon fibres (3). Furthermore, electrically conductive materials (5) which can be obtained in a corresponding manner are proposed. Finally, a radiator (12) which contains a transparent or translucent housing (13) and an electrically conductive material (5) according to the invention is provided. The invention makes it possible to provide electrically conductive materials (5) having an increased electrical resistance. In this way, radiators (12), in particular, having virtually any length can now be operated at conventional grid voltages.
