Abstract (en)

[origin: EP2740363A1] The dough components are mixed in a dough-mixing apparatus (2). The dough produced is divided into portions, each of which is aerated, producing aerated dough. The mixing and aeration are conducted by different devices. The aeration is conducted under a pressure of a minimum of 0.3 MPa with subsequent reduction of the pressure to atmospheric pressure at an adjustable rate of the order of 0.02-0.2 MPa/s. The pressure is reduced to atmospheric pressure either before or after removing the aerating device (6) from the dough. The aeration process is conducted in baking moulds (1), or in intermediate vessels (16), followed by transfer into the moulds (1). The transfer is made either into moulds (1) which are under atmospheric pressure, after reducing the pressure in the intermediate vessels (16) to atmospheric pressure, or into moulds (1) which are under elevated pressure, and the pressure is reduced to atmospheric pressure after the transfer. The invention makes it possible to simplify and to increase the accuracy of dividing the dough, to enhance the quality of the aerated dough, to reduce energy consumption and to increase production efficiency.
