Abstract (en)
[origin: EP2740989A1] The lighting device relates to light-emitting diode lighting equipment and is easily adapted for various outdoor lighting tasks. The technical result consists in reducing the labor intensity of the assembly and in decreasing production costs. The lighting device comprises a main light-emitting diode module, at least one additional light-emitting diode module, and a means for connecting said modules. The housing of the modules is manufactured by an extrusion procedure and has an inner and an outer cylindrical surface, while the means for connecting the housings is in the form of a sliding pair, wherein the first member of the sliding pair is formed on the surface of the housing of the attached module, and the second member is formed on the surface of the housing of the additional module.
