Abstract (en)
[origin: WO2013020154A1] The invention relates to a transport container (1), in particular a vehicle body or container, having a frame structure (2) and a wall (4) that can be moved by means of a pivoting device (1') arranged in particular in the roof region (3) between a closed position in contact with the frame structure (2) in which the wall closes a loading opening, and an open position, in which the wall exposes the loading opening. The pivoting device (1') comprises a guiding element (6) pivotally mounted on the frame structure (2) and the wall (4) respectively, which guiding element is pivotable by means of a drive unit (5) between the closed and the open position of the wall, wherein the pivoting device comprises a rocker arm (9) connected in an articulated manner to the guiding element (6) and to the wall (4) respectively. The rocker arm (9) is designed to convert a pivoting of the guiding element (6) out of the closed position of the wall (4) at least in the region of a contact surface between the wall (4) and the frame structure (2) into a displacement of the wall (4) from the closed position substantially perpendicularly to the plane in which the wall (4) extends into an intermediate position spaced apart from the frame structure (2), from which intermediate position the wall (4) can be moved into the open position.
