Abstract (en)

[origin: EP2742818A1] The system has a backbone shank (B), elastic stick (S) and rubber strap (R) connected with one another. A rib structure engages the rubber strap into a hole of a backbone body (V). An upper strap of the backbone shank is designed as a joint, and an inner thin and flexible mounting sole is provided with a click rail (C). An outer sole is attached to an inner sole. The backbone shank is engaged into a click closure and connected with a pointe shoe in a fixed manner by a locking system, where bending characteristics of the shank are controlled by the stick.
