Abstract (en)
[origin: EP2743952A1] The contactor has a set of terminals (2), and a conducting element (3) i.e. elastic capsule, that is capable of moving relative to the terminals so as to occupy an open position in which the set of terminals is insulated, or a closed position (12) in which the element carries out a contact between the terminals. The terminals are arranged interdependent of an elastically deformable membrane (4) so as to allow displacement of the element from the open position towards the closed position under the effect of a digital support (13) and to allow automatic displacement when the support ceases. An independent claim is also included for a method for manufacturing an electric contactor.
