Abstract (en)
[origin: WO2013024089A1] The invention relates to a coupling system for removably connecting a container (12) to a support structure (24). The container (12) comprises a rear wall (82), a front wall (84), lateral walls (18) which laterally connect the rear and front wall (82, 84), and a base element (16). Each of the lateral walls (18) comprises an inner and outer wall (22, 36), each outer wall (36) being formed by a lower outer lateral wall element (86) and an upper outer lateral wall element (88). The lower outer lateral wall element (86) is designed so as to be movable together with the inner wall (22) relative to the upper outer lateral wall element (88). Each coupling system (10) comprises at least one support rail (42) which is arranged on or within the lateral wall (18), said support rail comprising a guiding groove (48) for receiving at least one respective support element (26) which is arranged on the support structure (24). The mobility of the lower outer lateral wall element (86) relative to the upper outer lateral wall element (88) can be regulated by at least one actuating device (60) for moving at least one locking element (44) from a locking position, in which the locking element sits at least partly against at least one locking catch (46), into a free-running position, in which the locking element does not sit against the locking catch (46), and vice versa.
