Abstract (en)

[origin: EP2746050A1] The method involves detecting a position a contact point, in which a printing pad (15) and a printing plate (12) meet one another during print image recording, and/or another contact point, in which the printing pad and an object to be printed meet one another during a print image transmission. A speed function is determined based on the detected position. The pad is moved relative to the plate during another print image recording and/or relative to the object during another print image transmission with a speed according to a speed function. An independent claim is also included for a pad printing machine.
