Abstract (en)

[origin: EP2746183A1] The invention comprises a one-piece body (1) in the form of a domed component, of any external geometrical configuration, which converges towards the opening (2) thereof, the inner wall of which has a profile or a generatrix that coincides with that of the bottle neck with which it has to fit tightly, a protuberance (12) of hemispherical configuration emerging downwards from the bottom of the base thereof, which projection is designed, in turn, to penetrate tightly inside the bottle neck, this coupling being facilitated by the existence of a bevel (6) at the mouth of the stopper. This results in a stopper that, despite being made from silicone, can easily be coupled to the bottle and is capable of withstanding the pressure inside the bottle without accidentally becoming detached therefrom.
