Abstract (en)
The present disclosure concerns roof gutters, more particularly modular gutter elements for mounting along roof edges or eaves. The gutter element has a generally tubular form, with solid metal water-impermeable bottom and sides, and a perforated metal water-permeable covering. It is characterized in that: - the gutter element has at least one end either narrowed or widened, so as to permit telescopic connections between elements; - the gutter element is equipped on each of its two lengthwise sides of integral suspension means. Such an element lends itself for assembly of both right and left downward sloping gutters.
