Abstract (en)

[origin: EP2746788A1] The invention relates to method of detecting out of step presence in an electric power network. The method is based on a protection device (2, 3) having means (3) for measuring voltage and currents signals of the electric lines (1) at a local (A) and remote (B) terminals and having a computer means for data processing and calculation a frequency of current and voltage at the local terminal (A) and at the remote terminal (B) and for calculating a value of the frequency. The method further comprises the following steps: calculating a value of difference of frequency differences #f between the local (A) and remote (B) terminals, determination criteria Crit1, Crit2, Crit3, Crit4 for out of step detection and configuration of special thresholds for each criterion by a user, determination of the presence of out of step through a logic product of the results of all criteria and automatically creating a signal for activating remedial action, triggering an alarm or passing the signal indicating the out of step detection to other protection devices.
