Abstract (en)

[origin: EP2747328A1] The method involves establishing a local jamming situation at the level of each of friendly reception platforms, and measuring jamming signals received by the platforms and originating from jammers. Fratricidal jamming levels are estimated based on the measurement of the jamming signals. One of configuration parameters such as a frequency plan, and/or temporal positionings of the transmissions, antenna diagrams and/or orientations, radio access schemes and modulation/coding schemes is determined for each of transmission platforms, so as to be utilized in transmission and/or reception.
