Abstract (en)

[origin: WO2013026147A1] Provided is a method and system for capturing and validating a signature using a mobile device in order to attach a signature to an item. The method generally comprises displaying or transmitting the signee the instructions to sign the item. The signee then uses his mobile device application to select one or more of the items requiring a signature. Then, the signee uses his finger (or fingers) or a stylus against the mobile device's touch sensitive screen to capture his signature. The captured signature is then validated before being retrieved and finally attached to the item using a secure server.
