Abstract (en)

[origin: US2013055518A1] A hairbrush has a plurality of molded tines, each with a main shaft and a first branch extending from the shaft. The first branch extends at a point between the base of the shaft and the free end of the shaft, and is oriented on the shaft and dimensioned such that the tine is adapted to comb and separate tangled or matted hair. The tines may be arranged such that the first branch of one tine is randomly oriented relative to the first branch of adjacent tines. The tines may have a second branch extending from the shaft at a point between the base of the shaft and the first branch. The first and second branches extend in a radial direction from the shaft at an angle of 5° to 90° relative to a longitudinal axis of the shaft.
