Abstract (en)
[origin: WO2013030507A1] The invention relates to a device for handling a load (C), including a screw assembly provided with a gripping means and capable of connecting to said load. The handling device is characterised in that it includes: a first screwing indicator element (6) secured to said screw assembly; a second screwing indicator element (7) translatably movable relative to said first element; and a resilient return means (16). Said resilient return means (16) is inserted between the first screwing indicator element (6) and the second screwing indicator element (7), and has the effect of returning the second screwing indicator element (7) such that the latter engages with the load (C), such that the coincidence of the two screwing indicator elements indicates that the handling device (1) is sufficiently screwed onto said load (C).
