Abstract (en)

[origin: US2013058227A1] A network resource module communicatively interfaces a resource manager with one or more network nodes in a communications network. Each network node provides one or more network resources that may be used to create a virtual infrastructure for a virtual network. The network resource module detects the network nodes, abstracts the resources associated with the network nodes at a desired granularity (e.g., node level or flow level) into Virtual Resource Objects (VROs), and then publishes the VROs in a registry. Thereafter, Virtual Network Operators (VNOs) select desired VROs from the registry to build the virtual infrastructure for the virtual network.
