Abstract (en)

A device suitable for the electrochemical processing of an object is at least provided with a chamber that is to accommodate an electrolyte, means for supporting the object that is to be processed in said chamber, at least one set of electrodes extending parallel to each other, which electrodes are located in said chamber such that during operation at least one electrode is located opposite each portion of a surface of said object that is to be processed, as well as control means for providing an electric current between the object that is to be processed and the electrodes. A number of electrodes is arranged with fixed spacings on nodes of a raster pattern, whilst at least one electrode is located at a position shifted with respect to the nearest node of the raster pattern.
