Abstract (en)  
[origin: WO2013037936A1] The invention relates to a package carton (GBK) for receiving a package of cigarette packs, the package carton comprising first (TP1) and second (TP2) part packs, and the first part pack including a tab (LA) and the second part pack including a slot (SZ) for receiving the tab, the tab being adapted to be detached out of a wall (DW12) of the first part pack by means of a partly circumscriptive separating line (SL) and extending away from a first edge (K11) of the first part pack and being adapted to be deflected out of the wall about the first edge, the tab still being hinged to the wall along the first edge, the slot being likewise located on a first edge (K12) of the second part pack, the first edge of the first part pack and the first edge of the second part pack coming to rest against each other to form the package carton such that the tab in the deflected-out condition can be inserted into the slot for a hinged connection of the two part packs, the tab including lateral shoulders (ABS1,ABS2) which restrain the tab inserted in the slot such that the first part pack and the second part pack are held against each other along their first edges and can be swiveled relative to each other about the first edges.
