Abstract (en)

[origin: WO2013038088A1] The invention relates to a system (7) for transmitting movement from at least two cams (5) to at least one valve (2), said system comprising: a first push element (8) configured to be positioned facing a first cam (5), a second push element (9) configured to be positioned facing a second cam (5) having a different profile from that of the first cam, a locking element (15) that can be moved between a position in which it solidly connects the first (8) and second (9) push elements and a position in which the first (8) and second (9) push elements are not solidly connected to one another, and an electromagnetic actuator (30) configured to move the locking member (15) from one position to the other.
