Abstract (en)

[origin: EP2757200A2] The apparatus (1) has a frame (4) to receive an object (2) e.g. pile or a tube, and a vibrator for extracting or recessing the object in a ground. The vibrator includes two vibrator modules, and the frame includes a side opening (5) to allow insertion of the object by a lateral translation movement in the frame between the vibrator modules, where the object is in a driving position. A tightening unit of the object partially closes the opening when the object is maintained. The tightening unit includes jaws (6) moving between retracted and tightening positions. An independent claim is also included for a method for maintenance of an object e.g. pile or tube, for extracting or recessing the object in the ground.
