Abstract (en)

[origin: WO2013040619A1] A method is described for producing a footbed for a shoe with a perforated flat structure (5) which absorbs tensile forces and is held in a freely spanned manner with the aid of a covering frame (9) in a supporting frame (4) which defines the edge profile of the footbed. In order to provide an advantageous connection between the flat structure (5) and the supporting frame (4), it is proposed that, during the production thereof from a plastic melt, the covering frame (9) is moulded through the perforated flat structure (5) onto the supporting frame in a material-to-material manner.
