Abstract (en)

[origin: WO2013041716A1] The invention proposes a cap (10) referred to as an "anti-drip" cap for a deformable bottle (12) comprising a base (16), communicating with the bottle, covered by a cover (26), comprising an outlet (30), said cap (10) being moveable between a configuration for closing and locking corresponding to a first angular position and a low vertical position of the cover (26), an intermediate configuration of the cap (10) for venting via a leakage means (38) corresponding to a second angular position and the low vertical position of the cover (26), and a dispensing configuration of the cap (10) corresponding to the second angular position and a high vertical position of the cover (26) in which the outlet (30) is released, the cap (10) passing from the intermediate configuration to the dispensing configuration when the cover (26) is moved by the pressure from a product supplied to the base (16), and returning to the intermediate configuration when the cover (26) is returned under the effect of an elastic return means inserted between the cover (26) and the base (16).
