Abstract (en)

[origin: CH705546A2] The clothes dryer has drum (1) with horizontal axis of rotation for receiving laundry to be dried. A process air circuit directs heated process air through drum for cooling process air for purpose of dehydration and re-heating of process air. The process air circuit leads process air axially from rear face (16) to front side (15) of drum. The process air circuit is arranged with additional heat exchanger (4) for removing heat from process air circuit, and discharge of process air heat to ambient air. An auxiliary heater (10) is provided to heat the process air.
