Abstract (en)

[origin: WO2013045005A1] The invention relates to an electrically insulating rescue glove (10) comprising: at least one electrically insulating insulation layer (11); at least one electrically conductive outer layer (12), which at least partially covers the insulation layer (11); at least one electrical connection location (22); at least one signalling device (14), which is connected electrically to the outer layer (12) and each connection location (22); wherein the signalling device (14) is designed such that it generates a warning signal in dependence on a potential difference between the outer layer (12) and at least one of the connection locations (22).
