Abstract (en)

[origin: WO2013044372A1] An auto-adjusting device is provided for a binding system of a metallurgical furnace. The auto-adjusting device comprises a gauge or sensor that constantly or intermittently measures one of either the furnace binding forces or the pressure of an associated hydraulic system. A load adjustment mechanism responsive to a measurement by the gauge or sensor that exceeds a predetermined amount either above or below the desired load, then automatically adjusts the load of the binding system.
