Abstract (en)
[origin: WO2013045814A1] The invention relates to a method for calculating a route (R) for a transfer of data between a source node (Z) and a destination node (D) via at least one intermediate node (Ci) in a network comprising a plurality of nodes, which, for a current node (Zj) of said route, comprises a set of nodes adjacent to said current node. According to the invention, said method is suitable for selecting a selection law from a set of selection laws and for choosing an intermediate node (Zj+1) according to the current node (Zj), by applying the selected law to all or a portion of the nodes of the predetermined set for the current node. The invention likewise relates to a node-forming device (Ci) which implements the route calculation method.
