Abstract (en)
[origin: EP2762809A1] A refrigerant tube (4a) of condenser (4) is spirally wound into an elliptic shape, and a center of the spirally wound tube is serpentine-formed along a direction perpendicular to a principal axis of an air blower (5). An inlet port (4c) and an outlet port (4d) of refrigerant are linked with a connecting member (9) made of rubber, and the connecting member (9) plays a role of rubber vibration isolator for absorbing vibration of the condenser (4). The connecting member (9) also plays a role of maintaining relative positions of inlet port (4c) and outlet port (4d) in addition to suppressing vibration, thus making additional positioning part unnecessary and reducing a number of component parts.
