Abstract (en)

[origin: EP2763388A1] The present invention refers to a method (49) and device (25, 31, 43) for analysing and/or diagnosing physical media (13, 36) in an access network (11). In order to improve dynamic line management such that a long-lasting bit rate decrease because of transitory disturbance (47) in the access network (11) can be avoided, it is suggested that the method (49) comprise determining (55) a long-term statistical distribution (L) of a parameter that characterises the performance of at least one telecommunication line (13, 36) of the network (11); determining (57) a short-term statistical distribution (S) of the parameter; comparing (59, 61) the long-term statistical distribution (L) with the short-term statistical distribution (S); and detecting (63) a transitory disturbance (47) in the at least one telecommunication line (13, 36) depending on said comparing (59).
