Abstract (en)
[origin: WO2013050082A1] A cell-pair specific measurement event configuration is provided. A first cell-pair specific parameter is included in a first condition to be met for triggering a measurement event report by a user equipment in a cellular communications network (S31), wherein the first condition includes measurements concerning a serving cell of the user equipment, wherein a dedicated value of the first parameter depends on a neighboring cell of the serving cell, which is taken for triggering the measurement even report. Dedicated values of the first parameter are assigned for each neighboring cell of the serving cell (S32), and the assigned dedicated values are set in the cell-pair specific measurement event configuration (S33). For triggering the measurement event report, the user equipment derives conditions including the first condition and the dedicated value for the neighboring cell taken for triggering the measurement event report from the cell-pair specific measurement event configuration.
