Abstract (en)
[origin: EP2765263A1] The lock has a stator, a rotor mounted in the stator in a rotatable manner. A key is inserted into a channel, and a locking member (10) locks the rotor. The member is moved between blocking and retracted positions. A stop (40) is fixed to the stator, and a latch bar (34) is rotatable about an axle (46) between locking and unlocking positions, where an end of the axle is mounted on a rail such that the axle is moved from high position in which the bar is separated from the stop by a clearance to a lower position. A return unit (56) biases the axle towards high position.
