Abstract (en)

A window blind includes a stationary seat (2), a blind mechanism (3), a coupling mechanism (4) and a control pole (5). The blind mechanism (3) includes a linking rod (31) mounted to the stationary seat (2) and a blind unit (32) wound on the linking rod (31). The coupling mechanism (4) includes a transmission unit (42) connected to the linking rod (31) and movable between an operable state and a non-operable state, a stop unit (44) for restraining rotation of the linking rod (31) when the transmission unit (42) is at the non-operable state, and a resilient member (43) for biasing the transmission unit (42) toward the non-operable state. The control pole (5) connected to the transmission unit (42) is operable for converting the transmission unit (42) to the operable state against a resilient force of the resilient member (43).
