Abstract (en)
[origin: WO2013054016A1] The invention relates to a device (1) for controlling a clutch, which comprises two main members, including: a clutch-release bearing (30), which is arranged such that it is mounted so as to be translatably movable relative to the housing of said clutch; and a fork (10), which is arranged such that it is mounted so as to be tiltably movable relative to the housing of said clutch, and which includes two bearing portions suitable for engaging with two corresponding bearing portions (34) of said clutch-release bearing in order to translatably move said bearing due to the tilting of the fork. According to the invention, the bearing portions of one of said two main members form grooves, and the bearing portions of the other of said two main members form bulges, each of which engage with the edges of the corresponding groove via point or linear contacts.
