Abstract (en)

[origin: WO2013107574A1] Method and apparatus for calculating a route for at least one object inside a predefined area or building, wherein a suitable sensor system is used to determine the current position data relating to the object, wherein the respective current position data are used to simulate a flow of objects, wherein respective updated route guidance information is provided for output means in the predefined area or building on the basis of the results of the object flow simulation. The current position data relating to the object are determined, in particular, by using the effects of near field communication (NFC), for example by means of RFID technology.
