Abstract (en)

[origin: CA2857608A1] In order to form a locking mechanism (1) for a switch-on button (2) of a circuit breaker which has a simple and inexpensive design, it is proposed that the locking mechanism (1) has a locking element (14) which is mounted rotatably on the switch-on button (2), which locking element (14), held directly in a first position by a first spring (18), enables actuation of the switch-on button (2) and, directly in the switched-on state of the circuit breaker by a second spring (21), can be moved into a second position, wherein the switch-on button (2) of the circuit breaker is locked to prevent actuation in the second position.
