Abstract (en)
   [origin: US2013090088A1] A method for seamlessly authenticating users of a first and second device is described. The method includes:
   determining a set of first signatures for a first device; generating a set of second signatures for a second device; comparing the set of first signatures
   with the set of second signatures; and based on the comparing, granting a user authentication status if a difference between the set of first
   signatures and the set of second signatures is less than a predetermined tolerance threshold, and rejecting the user authentication status if a
   difference between the set of first signatures and the set of second signatures is more than the predetermined tolerance threshold.
