Abstract (en)

[origin: EP2767719A2] The valve has a housing (3) that is arranged with a set of fluid ports. A supply connection (P) and a service terminal (A) is arranged in the housing. A movable control piston (11) is arranged in the housing for controlling of the set of fluid ports. An operating unit (13) is arranged for providing different control states for the control piston. One control state of the operating unit is varied by a pressure limiting device when inlet pressure changes in a supply port to a definable pressure level with regard to an output pressure in the service terminal.
