Abstract (en)  
[origin: WO2013057053A1] The invention relates to a refrigeration device, in particular a household refrigeration device, with a thermally insulating wall (1) having a thermal insulation layer (7) produced by applying foam material between an interior panelling (3) and an exterior panelling (5), which interior panelling (3) comprises an assembly opening (19) in which a backing piece (11) is inserted, at least one edge web (23) of which reaches in a final assembly position (E) over the opening edge of the assembly opening (19) on the side (27) of the interior panelling (3) facing away from the thermal insulation layer (7) and has an elastically yielding sealing element (29), which is braced against the side of the interior panelling (3) facing the thermal insulation layer (7) and presses the edge web (23) of the backing piece (11) against the interior panelling (3) with a bias force (FV). According to the invention, a transverse stop (31) is formed on the contact side (25) of the edge web (23) facing the interior panelling (3), said transverse stop projecting in the final assembly position (E) into a locking recess (19; 39) of the interior panelling (3) and securing the backing part (11) in a stationary position preventing a transverse displacement along the wall plane.
