Abstract (en)

[origin: EP2769848A2] The method involves measuring first and second position values (H1,H2) of an object (3) at first and second positions (P1,P2) respectively. A position change of the object perpendicular to a conveying direction (5) is determined by using position values. The position change is compensated, when printing one portion (A2) of a print image (2) to other portion (A1) by essentially seamless printing by using position change of corresponding number of nozzles within an overlap region (L) of one field (F2) and complementary number of nozzles outside of overlap region.
